DIVERSITY**
CogSci 2022

Structured Signaling Game

	w_1	w_2	w_3
Red	1	0	0
Blue	0	0.8	0
Green	0	0	0.4
Yellow	0	0	0.5
Cyan	0	0.7	0.1

- Agent has access to a meaning function and a similarity measure between meanings $Z_{mm'} = e^{-\sigma \|x_m - x_{m'}\|^2}$
- Perfect communication not possible
=> Need to minimise the total distortion

Rational Speech Act Framework

RSA

$$L_0(m|w, C) \propto \mathcal{L}(m, w)$$

$$S_t(w|m, C) \propto e^{\alpha U_t(m, w, C)}$$

$$L_t(m|w, C) \propto S_t(w, m, C) p(m|C)$$

$$U_t(w, m, C) = \log L_{t-1}(m|w, C)$$

Frank and Goodman 2012

sRSA

Similarity sensitive surprisal (Leinster 2021):

$$S_t(w|m, C) \propto \left(\sum_{m' \in C} Z_{mm'} L_{t-1}(m'|w, C) \right)^\alpha$$

Two Studies

- Meaning functions derived from the World Color Survey (WCS) (Berlin and Kay 1969).
- Meaning functions developed by artificial agents in a reinforcement learning framework.

$$\begin{aligned} L_0(m|w) &\propto \mathcal{L}(m, w) \\ S_t(w|m, C) &\propto e^{\alpha U_t(m, w, C)} \\ L_t(m|w, C) &\propto S_t(w|m, C)p(m|C) \end{aligned}$$

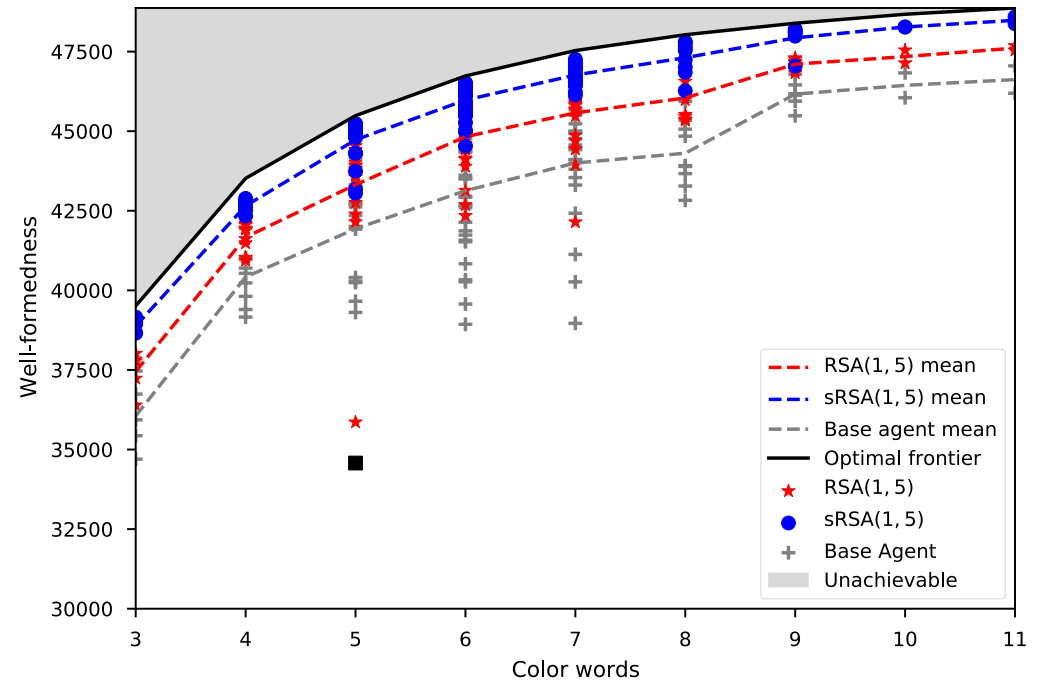

Neural Network

WCS Representations

IB-Frontier

Zaslavsky et al. 18

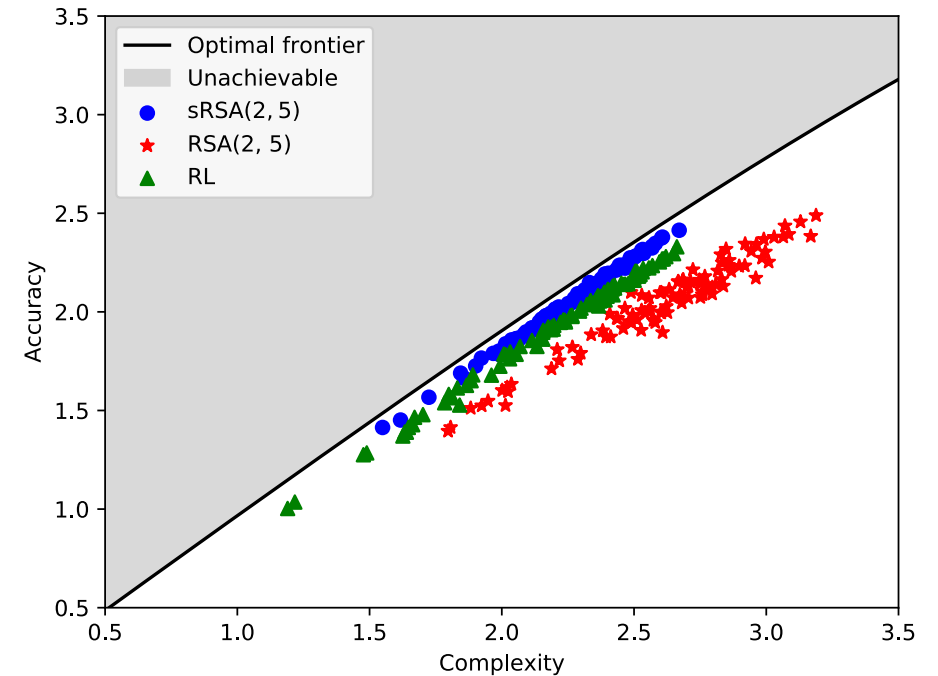

Well-formedness

Regier et al. 07

Reinforcement Learning

- sRSA+RL led to more efficient communication compared to just RL and RSA + RL.
- Explicitly accounting for the structure in the reasoning process improved over only accounting for it in the meaning function.
- Increased recursion depth => increased efficiency and more ambiguity neural representation.

Summary and Future Directions

- Accounting for the structure in the reasoning process greatly improves the efficiency
- In the future,
 - more realistic scenarios (e.g. color setup from Monroe et al., 2017)
 - Uncertainty in the similarity function
 - Other domains
